

Lezione 1

introduction & schematic

Stefan Cristi Zugravel
13/01/2026

Course Objectives

- Manage hardware projects using **Git version control**
- Design **PCB schematics and layouts** using **KiCad**
- Perform **basic SPICE simulations** to validate critical circuits
- Understand **FPGA architecture and HDL design methodology**
- Develop, simulate, and synthesize simple **VHDL modules**
- Use **XILINX VIVADO** and integrate IP cores

PCB, electronics

- Consumer Electronics
- Industrial & Automotive
- Telecommunications & Networking
- Medical Electronics
- Aerospace, Defense, & Maritime
- Lighting
- Instrumentation
- Ecc

Tools Used

- Git (versioning)
- Draw.io (block diagrams)
- KiCad (Schematic & PCB)
- NGspice & LTspice (simulation)
- XILINX VIVADO (FPGA)

Git

Draw.io – wavedrom – sankeymatic – MS Visio

Major Electronic Design Automation (EDA) vendors

SPICE simulation

	 LTspice®	 PSpice®
	 SIMULATION	LTSPice v/s PSPice
Parameter	Linear Technology's SPICE	Personal SPICE
Cost & Licensing	Completely free (even for commercial use)	Paid (Full version); free version is limited
Simulation Speed (Switching Circuits)	Extremely fast, optimized for SMPS & analog switching	Slower in power circuits, can require convergence tweaks
User Interface & Learning Curve	Lightweight UI, scripting-based setup	Advanced GUI with easier access to features
Analog vs Digital Support	Strong analog focus, minimal digital logic	True mixed-signal with full digital gate library
Monte Carlo & Tolerance Analysis	Supported via scripting (.step, gauss()) – powerful but manual	Native built-in support with statistical tools
Integration with PCB Design Tools	No native PCB integration	Fully integrated with OrCAD/Allegro (Cadence Suite)
Model Library Support	Best with Analog Devices models; 3rd party models need tweaks	Wide vendor-neutral support (TI, ST, NXP, ON Semi, etc.)
Simulation Features (Advanced)	Supports behavioral modeling, parametric sweeps, some noise	Adds sensitivity, reliability, yield analysis, fault simulation
Best Use Case Fit	Analog design, SMPS, filters, discrete validation	Full system-level sim (MCU + analog + bus-level behavior + PCB)

FPGA design suite

- AMD Xilinx
- Intel FPGA (Altera)
- Lattice
- Microchip
- Other

Source: The Information Network

PCB design process

Gather requirements

Course goal (Gather requirements)

Resistive Plate Chamber (RPC) diagram

Develop a custom module used to detect currents from 5 μA to 700 μA .

- 8 inputs connected to a 16 bit ADC (8 to 860 SPS)
- Shunt resistor with Current-Sense Amplifier
- 20 KHz -3 dB FEE bandwidth low pass filtering
- Microcontroller data taking with of the shelf module.
- Low noise
- FEE insulated from digital section

Block diagram – 1

Hands-on session 0 – Git

“A distributed system to track changes in source code, enabling multiple people to work together on non-linear development.”

Setup & Basics

`git init` - Start repo

`git clone <url>` - Copy repo

`git add .` - Stage all

`git commit -m "msg"` - Save

`git push` - Upload

`git pull` - Download

Branch & Merge

`git branch` - List branches

`git checkout <branch>` - Switch

`git merge <branch>` - Combine

`git branch -d <name>` - Delete

Investigate & Fix

`git log` - View history

`git status` - Check changes

`git diff` - See differences

`git restore <file>` - Undo changes

`git stash` - Temporarily save

Hands-on session 1 – Draw.IO

A bit of nomenclature

Clock

A **clock** is a periodic timing signal used to synchronize operations in an electronic system, defining when data is sampled, transferred, or processed.

- **62.5 ns (16 MHz):** Arduino UNO
- **20.8 ns (48 MHz):** USB full-speed devices and many microcontrollers
- **10 ns (100 MHz):** Common system clock for digital logic and CPUs
- **1 ns (1 GHz):** High-speed processors and modern communication systems

Skew and Jitter

(a)

(b)

- **Skew** is the fixed or slowly varying difference in timing between related signals (for example, two clock or data lines) that are intended to arrive simultaneously but do not due to path length, component, or loading differences.
- **Jitter** is the short-term, random or deterministic variation in the timing of a signal's edges from their ideal positions, typically caused by noise, interference, or instability in the clock source.

SPI (Serial Peripheral Interface)

SPI is a synchronous serial communication protocol used for short-distance communication between a master and one or more slave devices. It uses separate lines for **data in**, **data out**, **clock**, and **chip select**, enabling high data rates and simple hardware. Communication is full-duplex.

I2C (Inter-Integrated Circuit)

I2C is a synchronous, multi-master serial bus that uses only two lines: a **data line** and a **clock line**. Devices are addressed, allowing many peripherals to share the same bus. It is widely used for low-speed communication with sensors, EEPROMs, and configuration devices.

JTAG (Joint Test Action Group)

JTAG is a standard interface used for **testing, debugging, and programming electronic devices**. It provides access to internal registers and logic through a small set of dedicated pins. JTAG is commonly used for boundary-scan testing and in-system debugging of microcontrollers and FPGAs.

Single ended & Differential signaling

Single-ended signaling transmits information using one signal line referenced to a common ground. It is simple and low-cost but more susceptible to noise, ground offsets, and electromagnetic interference, especially at high speeds or long distances.

Differential signaling uses two complementary signal lines, and information is conveyed by the voltage difference between them.

LVDS (Low-voltage differential signaling)

TMDS (Transition-minimized differential signaling)

HDMI Cable (TL) Construction

PCB development and history

PCB in 1970s

PCB Now

Why we need Printed Circuit Boards

An old Motorola television without PCB from 1948

- Miniaturize devices
- Improve mass production
- Reduce cost
- Improve yield
- Increase repeatability
- Reduced parasitics

How a PCB is made?

PCB stackup/1

PCB stackup/2

isola

185HR

High Reliability Epoxy Laminate and Prepreg

185HR laminate and prepreg materials are a proprietary, high-performance resin system with a Tg of 180°C for multilayer Printed Wiring Board (PWB) applications where maximum thermal performance and reliability are required.

Constructions	Resin Content %	Standard/Alternate	Thickness (inch)	Thickness (mm)	Dielectric Constant (DK) Dissipation Factor (DF)

Type	Through Via	Tented Via	Blind Via	Buried Via	Stacked Via	Via in Pad

Tracks

Track impedance

“In electrical engineering, impedance is the opposition to alternating current presented by the combined effect of resistance and reactance in a circuit.”

The characteristic impedance of a line is the impedance seen by a wave front traveling down the line

The trace width, dielectric thickness, and dielectric material are the only factors that set the impedance.

$$Z = \frac{87}{\sqrt{\epsilon_r + 1.41}} \ln \left(\frac{5.98H}{0.8W + T} \right)$$

$$Z = \frac{60}{\sqrt{\epsilon_r}} \ln \left(\frac{1.9B}{0.8W + T} \right)$$

Decoupling capacitors

- Provide a small storage of power for briefs transients of current
- A low impedance connection for high frequency noise to ground

Attenuation

Impact of Dielectrics and Conductors

Effect of attenuation and dispersion, no reflections...

PAM4 -> 2 bit per symbol

**Double data rate w.r.t NRZ at the same bandwidth.
More complexity and more sensible to noise.**

Copper thieving

Copper Thieving Pattern

Used to even out the copper distribution across a copper layer. The added copper isn't connected to any nets on the board and should not affect the functionality.

Care will be taken to ensure thieving will not interfere with any defined controlled impedance or RF signal lines the design may contain.

Length tuning

Components, SMD and THR

Surface Mount Device

- Better for automatic assembly
- Generally lower parasitics, less exposed metal, better for high frequency applications
- Can have a much smaller footprint

Through Hole Reflow

- Connection on all PCB layers
- Usable with breadboard and easier to hand solder
- Stronger mechanical connection

Footprint example for SMF and THR

SMD electronic component size

The Size of SMD BGA

The Size of QFP

Metric code	0201	0402	0603	1005	1608	2012	2520	3216	3225	4516	4532	5025

PCB parasitics/2

Distributed-element filter

A microstrip low pass filter implemented with bowtie stubs inside a 20 GHz Agilent N9344C spectrum analyzer

A microstrip hairpin filter followed by a low pass stub filter on a PCB in a 20GHz Agilent N9344C spectrum analyzer

Stepped-impedance low-pass filter formed from alternate high and low impedance sections of line

PCB layouts and noise considerations

GND Connection

Caging

- Shielding cans or shielding cages are typically made of aluminum and are mounted on the PCB around specific groups of components.
- These small metal shields are then connected to ground, forming a Faraday cage around the components.
- These mechanical components are most often placed on a PCB as an EMI solution, either to help with passing susceptibility testing, radiated emissions testing, or both.

GERBER

“The Gerber format is an open vector format for printed circuit board (PCB) designs.”

Bill Of Materials

- **Reference Designator(s);** i.e. “R1, R2, R3”
- **Description;** i.e. “10k 5% 0.125W Resistor”
- **Manufacturer;** i.e. “Vishay Dale”
- **Manufacturers Part Number;** it’s useful to link this to the datasheet. | i.e. “C0402C100J5GAC”.
- **Distributor;** once specified the distributor can be included. This will also help in tracking cost and leadtime as they may vary from one distributor to another. | i.e. “AVNet”
- **Distributor Part Number;** some PCBA manufacturing services require the customer to specify the distributor and orderable part number to save them time. It can take a significant amount of effort to shop around as to where to buy. | i.e. “C0402C100J5GACTU”
- **Package;** component size and shape | i.e. “SMD 0402”
- **Qty;** of each part per unit of product | i.e. “3”

29								

POS

- Designator - Component Reference Designator (e.g. C1, L2, R3)
- Mid X/Mid Y - The X/Y coordinate of the component centroid. Generally in mm
- Layer - Top / Bottom, the board side where the component should be placed.
- Rotation - The rotation of the component given in degrees.
- Recommended File Format: .csv, .xls and .xlsx.
